

New Relic for Microsoft Azure

Modernize your enterprise applications with confidence

Enterprise DevOps teams today need integrated monitoring solutions that not only consolidate reporting across a number of business functions, but provide meaningful insights that enable cross-functional teams to move faster. New Relic for Azure lets teams instrument everything for better visibility into applications, managed services, infrastructure, containers, microservices, and more. Performance metrics and events across the entire solution stack can be collected, correlated, and delivered back as actionable insights that empower DevOps teams to confidently adapt with changes.

Key Benefits

- Full-stack monitoring combines the power of New Relic APM, Infrastructure, Browser, Synthetics, Mobile, and Insights giving you visibility into every layer.
- Quickly identify, triage, and delegate application and infrastructure issues between Engineers and IT Operations teams, reducing friction.
- Focus on work that impacts the customer experience the most by identifying which services and systems are performing poorly.
- See how service dependencies impact the complete solution through cross application tracing via service maps in APM.

Modern SaaS APM Solutions

Application performance traces, metrics, and events are collected and sent to [New Relic's Digital Intelligence Platform](#) where they are ingested, transformed, and delivered back to users as insights via an intuitive web interface. Teams can quickly identify, triage, and resolve complicated issues that may span cross-functional teams and technologies.

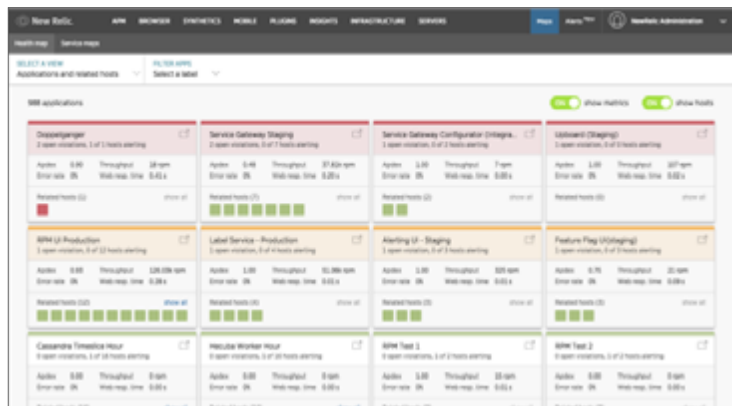

Monitor Apps & Services built using:

- .NET
- Java
- Ruby
- Python
- PHP
- Go
- Node.js

Monitor all your infrastructure in one place

New Relic Infrastructure lets you see all your resources independent of how or where you choose to run it. Hybrid and multi-cloud monitoring lets you see Azure hosts alongside on-prem Windows and Linux machines as well as hosts on other cloud platforms. See which applications and services are running poorly on specific hosts and drill down with New Relic APM to find the root cause.

Correlate apps and hosts

Health map enables DevOps teams to better understand how applications are running on clustered hosts they've been deployed to. A prioritized color-coded view makes it easy to quickly identify problem areas and drill down into specific hosts.

Cross-platform dashboards and alerts

Show that enterprise DevOps on Azure accelerates business, turning goals into quantifiable success. See how code deployments affect the customer experience with customizable dashboards in New Relic Insights displaying team KPIs across the full stack.

Visibility into Azure Services

New Relic Infrastructure Integrations allow you to monitor the real-time status of many popular Azure Services.

- Azure Virtual Machines
- Azure Service Bus
- Azure Functions
- Azure Virtual Networks
- Azure Cosmos DB
- More Soon...

“Using New Relic, we can easily instrument any application delivered on Azure and gain visibility into key performance and usage metrics.”

Steve Novoselac
Director of Digital Product Management, Trek Bicycle Corp.
